BY ARKESSA

The communication of real-time data collected by the Yanzi sensors to the cloud-based platform is provided via a 3G/4G enabled gateway which bridges to the IPv6 (IEEE 802.15.4) wireless sensor networks.

The processed data and business intelligence provided by the Yanzi solution enables companies to make decisions based on real-time information about their working spaces – increasing their capacity to run their buildings in the smartest way possible.

“The 3G/4G connectivity service provided by Arkessa compliments the rapid deployment and auto-provisioning USP of Yanzi. The cellular WAN approach enables the cloud connectivity without the need for interaction with local, often unwieldy, IT networks.”

Patrick Walsh, Chief Success Officer at Yanzi Networks
